Finally we made the first public beta of Multicategories Component for Joomla!1.6! There is not any functionality:) Just multcategory support. And our to do list:

- blog layout;
- system sef support;
- frontpage view.

And of course we are open for all your suggestions and bugreports too. You can place them in our new [Multicategories Component for Joomla!1.6 Forum](#) .

To download the component please go to [Multicategories Component for Joomla!1.6](#) project page.

Notice! Because of Joomla!1.6 has native support of multilevel categories we did not make separate table for Multicategories and corresponding admin view in backend. So now to add an article to several categories you should go directly to article and click Multicategories button under the editor window. In the modal window there will be a list of your Joomla! categories which can be selected with Ctrl+Click
